

Preface

Overview of Info 7 web project application deployment

1 installation

2 activate

3 deactivate and uninstall

4 update

5 version tracking

Preface

This application deployment guide describes deployment of application and application components to Info 7 web project application deployment Open source edition, and includes information about deployment descriptors

This preface contains information about and conventions for the entire info 7 web project application documentation set. The general deployment process consists of several interrelated activities with possible transitions between them. these activities occur at producer side, for user, it is free to download and install.

Our project provides web site user-friendly interface and costumed design according to users' desire. Through our website, not only we can monitor our home's parameter, but also, we can save the energy and make it more comfortable for your family members.

1 install

What do I need?

In order to run our source code, there are some software to be installed before.

- Install WAMP/MAMP according to your operation system you are using
- Text editor(sublime or other) to check if you want to view the source code(we do not advise you to change it)

Where I need to place the source file? The path

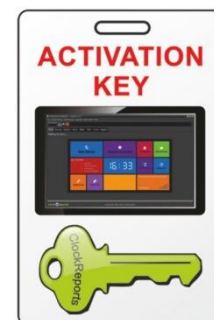

- After downloading your our file, move source files to the htdocs file in the WAMP/MAMP application .
- Move import the sql database file to the PHPmyadmin. Name a database with the title of our project's dabase name.

We recommend you to use 'root' as the default password for your WAMP/MAMP in order to provide the access to our source codes.

2 activate

Do not worry, as our website is free, we do not require you do any register or activation code.

All you need to do for activating your software is making the installation and path all right.

3 deactivate and uninstallation

Deactivation is the inverse of the activation, since our project don't require any activation, logically, it doesn't need any special deactivation procedure, all you need to do is delete the source file you have installed.

4 update

The update process replaces an earlier version of all or part of a software system with a newer release. it commonly consists of deactivation followed by installation.

Software
Update

5 version tracking

Version tracking systems helps the user find and install updates to software systems. We intended to design our website updating system on one click of a button which will launches a browser window to the update web page for the application, including auto-filling of the user name and password for sites that require a login. The user will see this feature the next version.
